Board Level API Functions

Overview

Int InitBoard (void))

InitBoard

This function returns the number of recognized devices.

int InitBoard (void)

Parameters:

Return Value:

Number of recognized devices.

Port API Functions

Overview

int	PortConfigure (WORD P4, WORD P5, WORD P6, WORD P7, WORD P1)
int	PortRead (BYTE *P4, BYTE *P5, BYTE *P6, BYTE *P7, BYTE *P1)
int	PortWrite (BYTE P4, BYTE P5, BYTE P6, BYTE P7)
int	Port1Write (BYTE act, BYTE pos)
int	PortConfigureEx (int nDevice, WORD P4, WORD P5, WORD P6, WORD P7, WORD P1)
Int	PortReadEx (int nDevice, BYTE *P4, BYTE *P5, BYTE *P6, BYTE *P7, BYTE *P1)
Int	PortWriteEx (int nDevice, BYTE P4, BYTE P5, BYTE P6, BYTE P7)
int	Port1WriteEx (int nDevice, BYTE act, BYTE pos)

PortConfigure

This function decides whether to use each port as input or output.

int PortConfigure (WORD P4, WORD P5, WORD P6, WORD P7, WORD P1)

Parameters:

P4: Delivers 16-bit values of upper Port 5 (7..0) and lower Port 4 (7..0).

P5 : Higher Port 1 (7..2), P7 (1..0) and lower Port 6 (7..0) 16-bit values are transmitted.

P6, P7, P1 : Not used.

Return Value:

If initialization fails, "0" is returned. If successful, "1" is returned.

PortRead

This function returns the current input state of each port.

int PortRead (BYTE *P4, BYTE *P5, BYTE *P6, BYTE *P7, BYTE *P1)

Parameters:

Pointer that can receive the value of each port (*P4, *P5, *P6, *P7, *P1)

Return Value:

If the read fails, "0" is returned. In the case of success, "1" is returned.

PortWrite

This function outputs each port as a specified value (except for port 1)

int PortWrite (BYTE P4, BYTE P5, BYTE P6, BYTE P7)

Parameters:

Port value to be output (P4, P5, P6, P7)

Return Value:

If writing fails, "0" is returned. In case of success, "1" is returned.

Port1Write

This function outputs each bit of port 1 as a specified value. Port 1's 0 and 1 are used as USB data lines, so the entire value cannot be written, and each bit (except bits 0 and 1) must be written separately.

int Port1Write (BYTE act, BYTE pos)

Parameters:

act : If it is '0', '0' is recorded, and if it is not '0', '1' is recorded.

pos : indicates the bit position (bit positions 2 to 7). The rest of the values are meaningless.

Return Value:

If the command fails, "0" is returned. In case of success, "1" is returned.

PortConfigureEx

This function decides whether to use each port as input or output. (For Multi-board)

int **PortConfigureEx (int nDevice, WORD P4, WORD P5, WORD P6, WORD P7, WORD P1)**

Parameters:

nDevice : Number of USB-LT02 devices detected

P4: Delivers 16-bit values of upper Port 5 (7..0) and lower Port 4 (7..0).

P5 : Higher Port 1 (7..2), P7 (1..0) and lower Port 6 (7..0) 16-bit values are transmitted.

P6, P7, P1 : Not used.

Return Value:

If initialization fails, "0" is returned. If successful, "1" is returned.

PortReadEx

This function returns the current input state of each port. (For Multi-board)

int **PortReadEx (int nDevice, BYTE *P4, BYTE *P5, BYTE *P6, BYTE *P7, BYTE *P1)**

Parameters:

nDevice : Number of USB-LT02 devices detected

*P4, *P5, *P6, *P7, *P1 : A pointer to the value of each port.

Return Value:

If the read fails, "0" is returned. In the case of success, "1" is returned.

PortWriteEx

This function outputs each port as a specified value (except for port 1). (For Multi-board)

int PortWriteEx (int nDevice, BYTE P4, BYTE P5, BYTE P6, BYTE P7)

Parameters:

nDevice : Number of USB-LT02 devices detected

P4, P5, P6, P7 : The value of the port to output.

Return Value:

If writing fails, "0" is returned. In case of success, "1" is returned.

Port1WriteEx

This function outputs each bit of port 1 as a specified value. Port 1's 0 and 1 are used as USB data lines, so the entire value cannot be written, and each bit (except bits 0 and 1) must be written separately. (For Multi-board)

int Port1WriteEx (int nDevice, BYTE act, BYTE pos)

Parameters:

nDevice : Number of USB-LT02 devices detected

act : If it is '0', '0' is recorded, and if it is not '0', '1' is recorded.

pos : indicates the bit position (bit positions 2 to 7). The rest of the values are meaningless.

Return Value:

If the command fails, "0" is returned. In case of success, "1" is returned.
